

Algae Research Project

Created by Hailey, Diadra, Annie, and Danya

Question

- In which watery environment does the algae reside in the highest concentrations?

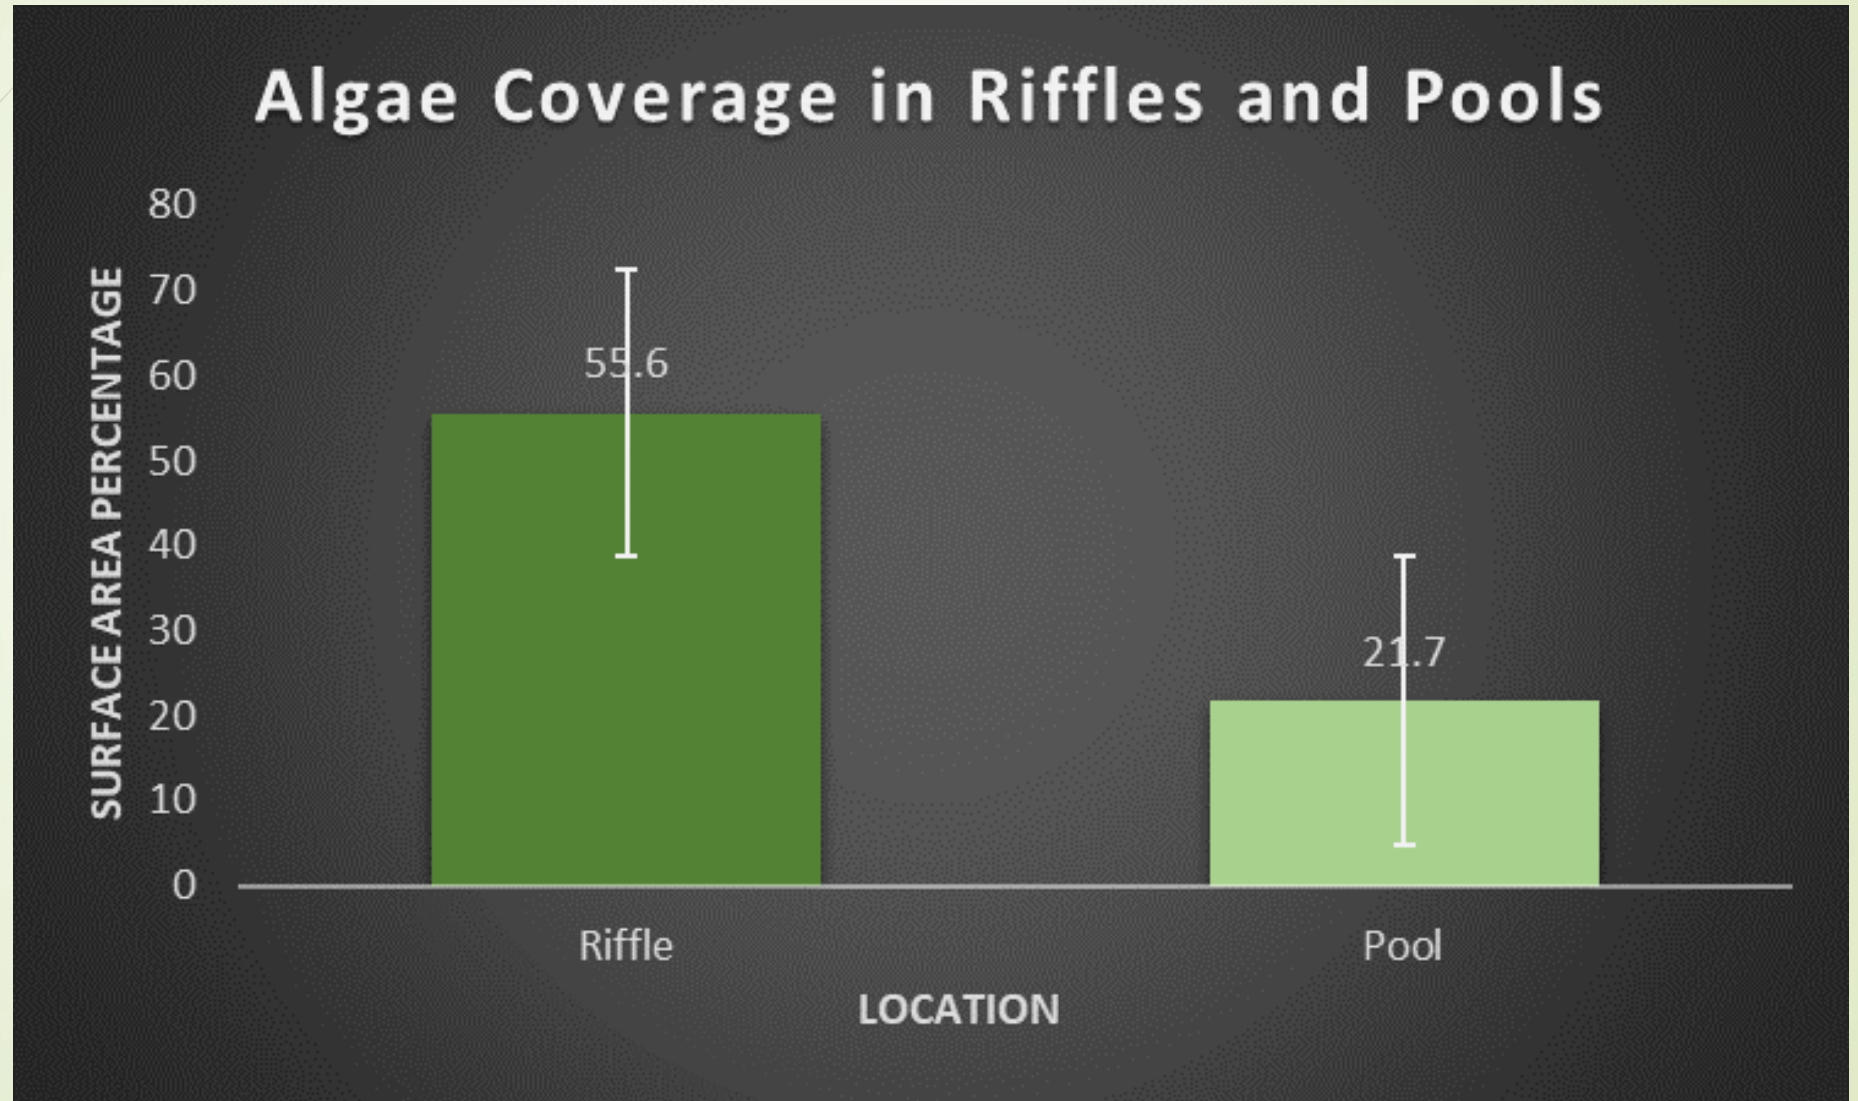

Hypothesis

- The pools would contain the most algae, because there would be no current to prevent it from growing and building up quickly.

Data

Conclusion

- ➔ We found that the algae concentration increased in riffle rather than the pool because there were more rocks for the algae to grow on, and the current didn't effect the algae growth as much as we thought it would in our hypothesis.
